

For my final project, I plan to use HTML, CSS, and JavaScript to create a more animated and interactive website for the Christmas season and as my final project. While I mainly want to play with JavaScript and CSS on my website, I plan to use HTML to add to the scenery and organize the objects and town but also to add more understanding as to what the interaction of the site is and the objective for the user. This will be done through having a brief sentence or quote that would continue along the top quarter of the page. This would be in black and be in calligraphy styled or decorative font than a casual one to fit with the traditional Christmas theme from films and books.

I plan to make my website Christmas themed since it is now December and as I would like to use that calm and cheerful feeling from the holiday and incorporate it into the visuals of the website. My index site would ideally have more of a horizontal snowy town landscape rather than a vertical one. It would have shops and Christmas decorations along the town road and have two shops that are interactive, leading to 2 other pages. These shops would be possibly a cafe and a flower shop that has various products displayed on a shelf. I plan to allow the user to view and choose between options displayed and collect them and have the option to exit and reenter the shops through the door. The other features along the street would include Christmas decorations including presents that the user can click on to reveal different gifts ranging from coal to toys.

Through JavaScript, I want to add a snowing animation on the index page of my website that overlaps the wording at the top as well as over the town shops and decorations. I also hope to possibly create figures, ideally humans, that can walk along the town road as the user is on the site and have said figures also stand idly in the shops as well. If I cannot make these figures human, then they will hopefully be at least snowmen.
